

Omniquad Border Secure

Complete perimeter Security and vulnerability assessment for your organisation.

Omniquad Border Secure addresses the key aspect of network risk management — vulnerability assessment. It is also the world's first system testing susceptibility to e-mail borne threats, making the Border Secure Service the most comprehensive network security service available today. Omniquad engineers in our operations centers will use a variety of commercial, automated and proprietary systems to identify system and e-mail vulnerabilities on your network. Acting as potential intruders without any prior knowledge of your systems, they will perform scheduled and selective checks of your communication services, operating systems, and routers in search of those vulnerabilities most often exploited to attack your network. Border Secure provides you with a comprehensive report detailing vulnerable areas and recommended solutions.

Vulnerability Assessment/Penetration Testing

The service provides on-demand and scheduled security audits that identify and analyse all the IP devices on your Internet connection. The discovered vulnerabilities are prioritised, allowing you to eliminate risks based on your resources and security policy.

E-mail Check

Omniquad is the *first vendor to introduce e-mail vulnerability testing* — the only available system that actively tries to compromise your network security by the use of e-mail. The system covers all types of risks associated with e-mail messaging and covers a range of scenarios: viruses, LoveBug-style and other types of scripts, executables and Trojans. During each scheduled assessment, E-mail Check will randomly send ordinary looking messages to a special alias account — each e-mail will be hiding a threat-assessment module. Each module has been designed to detect whether it managed to get through your e-mail screening system (if you have one); and finally what it could do at the end user's desktop.

As new vulnerabilities are discovered, we will automatically check our clients' networks, and report back with recommendations on how to fix exposed security threats, providing the most up-to-the-minute network audit available. Our Security Analysts working 24/7 stay on top of the security scenario. So we reduce the window of vulnerability between the exploit being published and intruders succeeding in their attempts to use it on your system. So, your enterprise is always up to date.

Features and Benefits of Border Secure

- ▶ Proactive vulnerability assessment
- ▶ Scalable Scans from single host to entire network
- ▶ Fully Managed Cost Effective Service
- ▶ No expensive infrastructure, extra hardware, software or training
- ▶ No need to divulge confidential information
- ▶ Up to 2000 different vulnerability tests including
 - ▶ Windows based attacks
 - ▶ Denial of service attacks
 - ▶ CGI Abuses
 - ▶ Root exploits
 - ▶ Port Scanning
- ▶ Assesses firewall's effectiveness in addition to applications and protocols such as web, FTP, and e-mail
- ▶ On Demand Security Audits: Scans can be requested after any network change
- ▶ Scheduled Security Audits: Scheduled and Ad Hoc Scanning takes place every day and reports are sent at regular intervals (less frequent). However, any vulnerability will be alerted the very moment.
- ▶ Comprehensive Reports: With Risk Profile Detection Evaluation and Prioritization, reports are sent to the client on regular basis.
